

Integrated Biodiversity Monitoring — Seaweed Farm

Protocol ID: berger_2024 *Print on waterproof paper. Use the sections for the methods you run.*

Site & visit

Site name / ID	Coordinates (lat / lon)	Date	Personnel

Environmental context (each visit)

Date	Site	Temp (°C)	Irradiance (lux)	Current (m/s)	pH	Salinity (psu)	Nutrients / notes

A · Direct observations — epibionts on lines & crop

Line / section	Location on line	Subsample #	Epibiont taxon	% cover on line	% cover on crop	Notes

Biofouling on crop blades:

Date	Biofouling taxon (on crop)	% blade cover	Notes

B · BRUV — deployment

Deploy date	Site	Depth (m)	Soak duration	Footage quality (usable Y/N)

BRUV — species (one row per species per deployment):

Species	Nmax (peak count)	Length (mm)	Notes

C · PAM — deployment

Deploy date	Site	Depth (m)	Deployment period

PAM — detections (one row per species):

Species	DPM / day	DPM / hour	Residency (min)

Nmax = peak number of a species seen simultaneously in the video. DPM = detection-positive minutes. Community composition is analysed in R (see workbook).
