Bivalve Meat Dry Weight – Data Sheet

One sheet per size class
25 animals · 5 trays of 5

Write each reading exactly as it comes off the scale and do the subtractions at the end. Label each tray with the size-class letter and a number (A1 to A5). Step numbers refer to the protocol.

Sampling details

Farm and site		Species	
Size class letter and description		Dryer used and its setting	
Date collected		Thermometer beside trays (°C or °F)	
Date opened		Check coin, first reading (g)	

Shell height (mm) – Step 3: longest straight line across the closed shell

	Tray 1	Tray 2	Tray 3	Tray 4	Tray 5
Animal 1					
Animal 2					
Animal 3					
Animal 4					
Animal 5					
Tray average					

Weights (g) – Steps 6 to 8

Reading	Date and time	Coin (g)	Tray 1	Tray 2	Tray 3	Tray 4	Tray 5
Animals in tray			5	5	5	5	5
Empty tray (check C)							
Tray + wet meat (Step 6)							
Dry weighing 1							
Dry weighing 2							
Dry weighing 3							
Dry weighing 4							
Dry weighing 5							
Dry reading = lowest reading							
Dry meat = dry reading – empty tray							
Wet meat = tray + wet meat – empty tray							
Dry meat as % of wet meat							

Dry rule (Step 8): weigh every 12 hours. A tray is dry when its reading drops by less than 1% since the last weighing – move the decimal point two places left to find 1% (1% of 8.74 g is 0.087 g). Its dry reading is the lowest one.

Result for the Filtration Service Estimator – Step 9

Total dry meat, all five trays (g)	
Number of animals	25
DTW (g) = total dry meat ÷ number of animals	
Shell height (mm) = average of all 25 animals	

Notes: anything done differently, problems, checks
